

## RESTful API

---

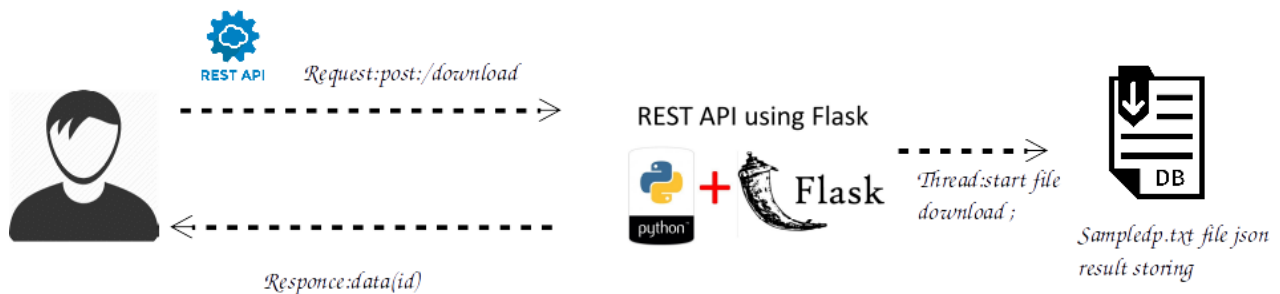

**ENPOINT URL** : <http://ec2-18-207-206-98.compute-1.amazonaws.com/>

(Amazon Ec2 Instance , Apache server )

**GITHUB REPOSITORY URL** : <https://github.com/6gvinoth/Api/>

**END POINT [1]** : /download

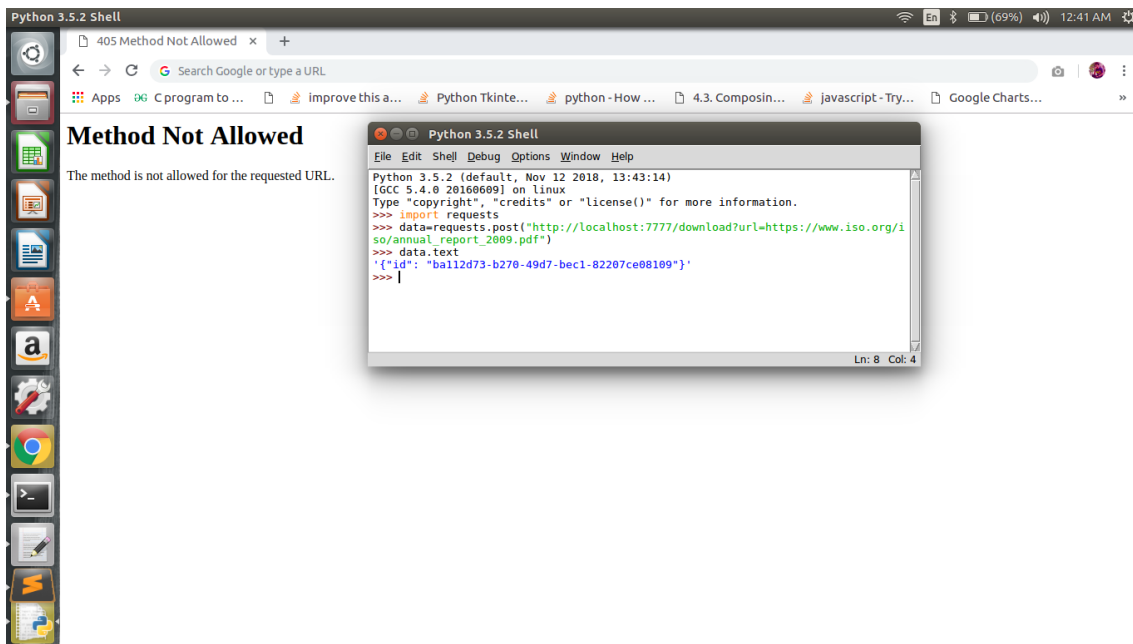

POST <http://ec2-18-207-206-98.compute-1.amazonaws.com/download?url=<input>>

### Explanation [1]:

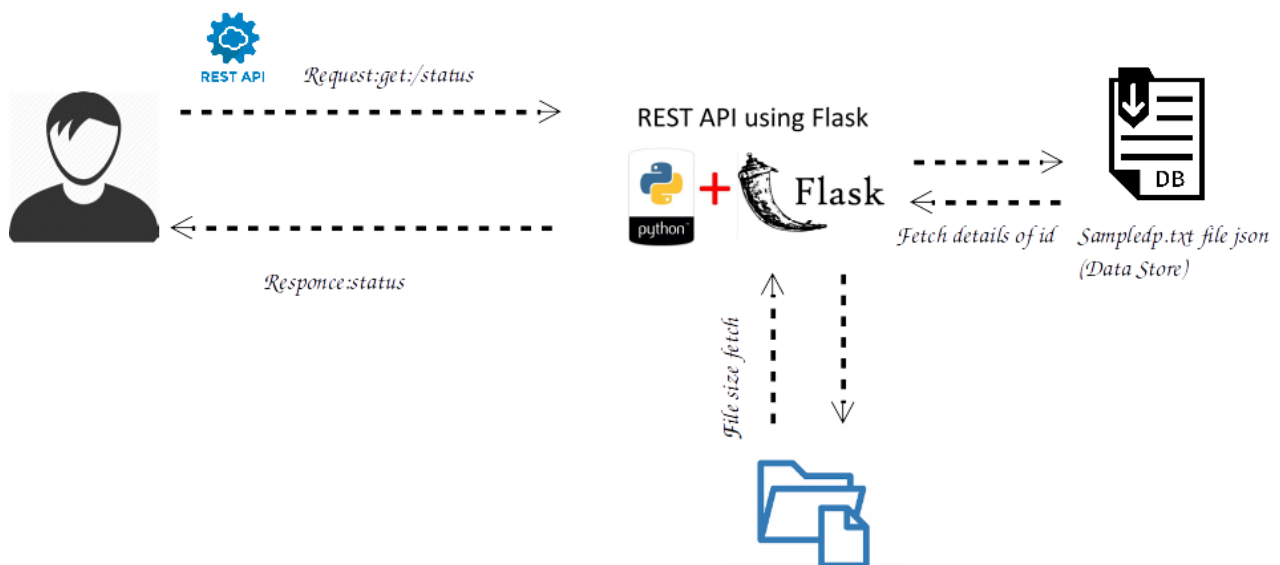

- > Checking connection from given url ,if any error in connection Error message will be returned as response
- > Unique id will be created (using uuid)
- > Unique id and data of url details will be stored in local dbfile(id as key ,value as ; header content ) .
- > start one thread to download process .
- > return id to response

### Screenshot [1]:

**END POINT [2] :** /status

GET <http://ec2-18-207-206-98.compute-1.amazonaws.com/status?id=<input>>

**Explanation [2]:**

- > checking given id from db (filedb.txt file here )
- > If id doesn't exists, Error message will be returned as response
- > if given id is available in db ,fetch the respective id data from db
- > from that data ,compare internal file size and original file size
- > based on that report will be generated and returne the result to response .

## Screenshot [2]:

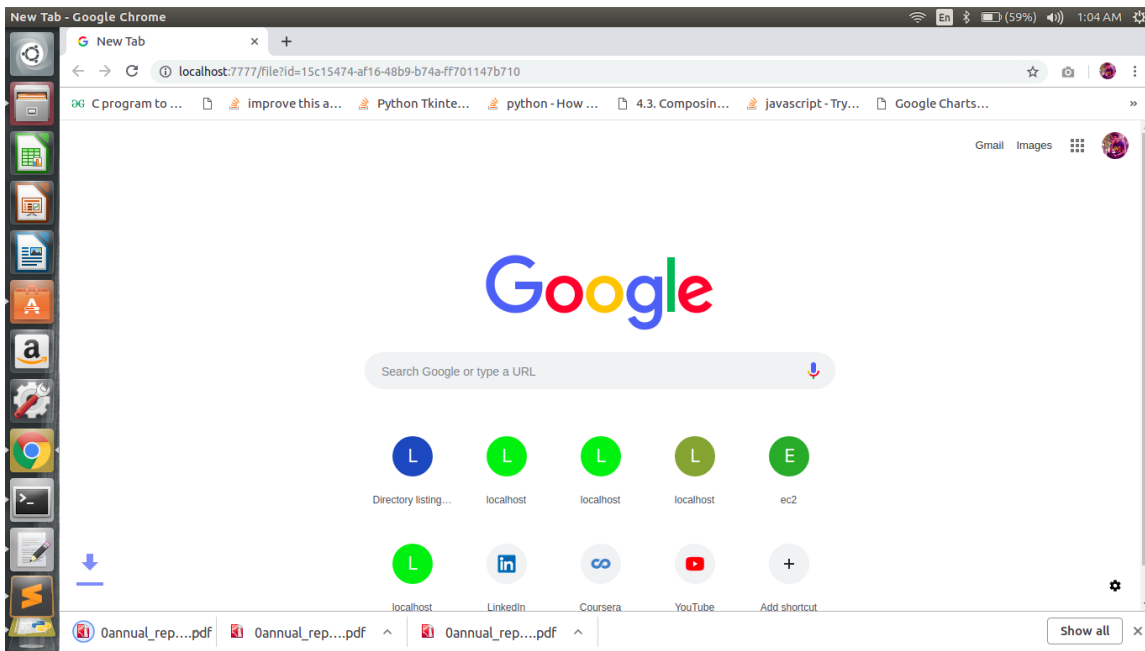

**END POINT [3] :** /file

GET <http://ec2-18-207-206-98.compute-1.amazonaws.com/file?id=<input>>

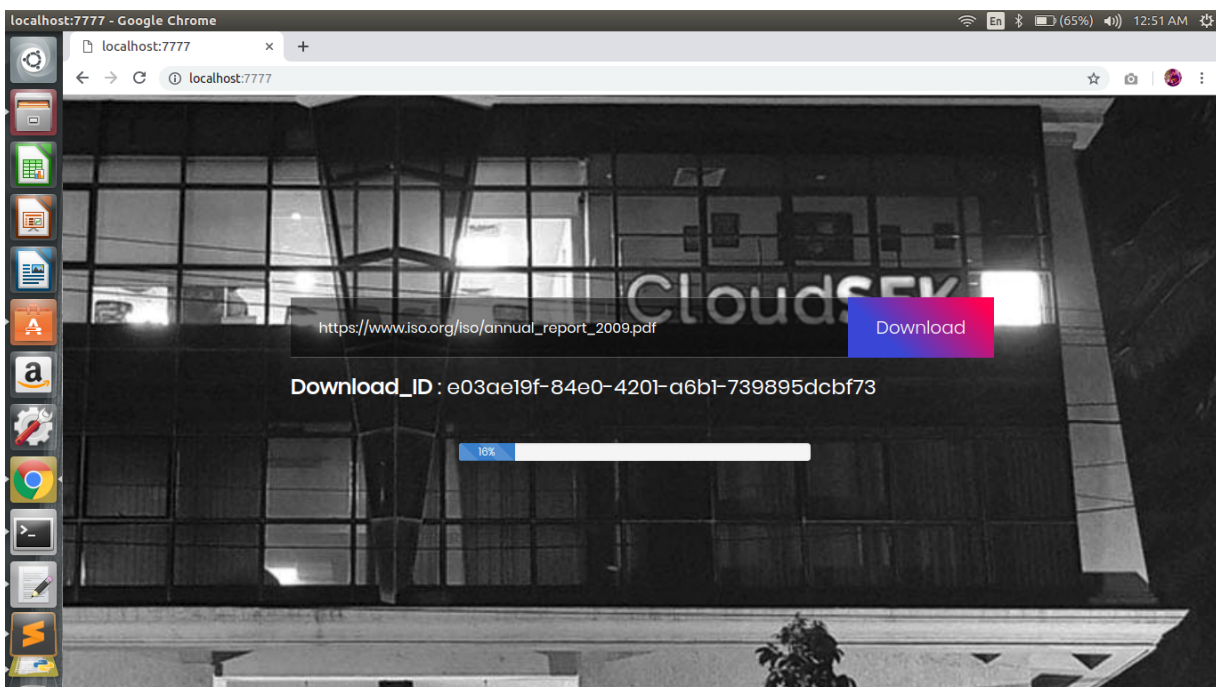

**Explanation [3]:**

- > checking given id from db
- > if id is available fetch information and serve that respective file to download .

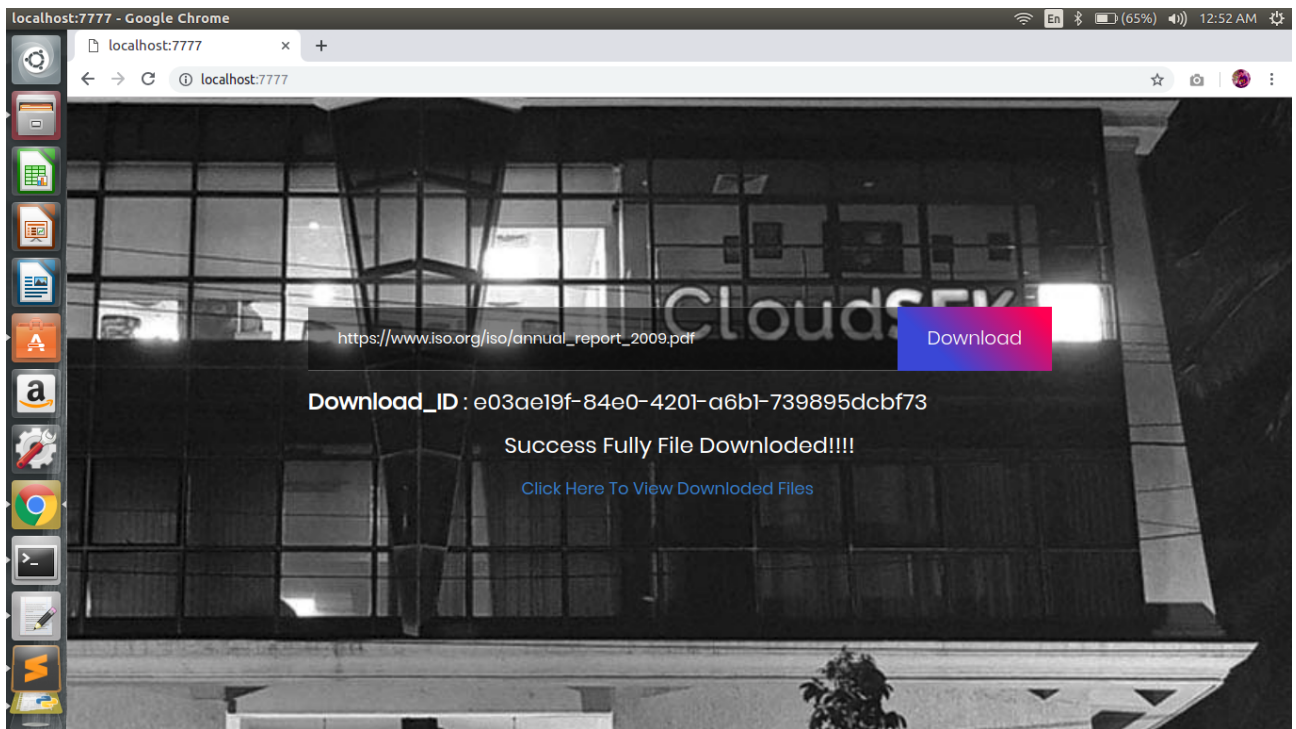

**Screenshot [3]:**

## Application for Downloader

- > Enter url and press Download button to download file .
- > progress bar shows percentage of downloading.

-> click here to view button to view downloaded file
