RESTful API

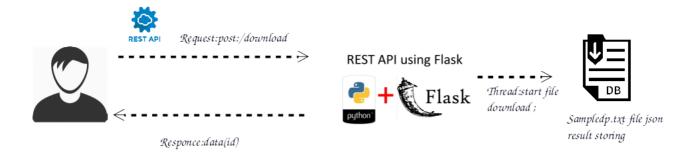

ENPOINT URL : http://ec2-18-207-206-98.compute-1.amazonaws.com/

(Amazon Ec2 Instance, Apache server)

GITHUB REPOSITORY URL : https://github.com/6gvinoth/Api/

END POINT [1]: /download

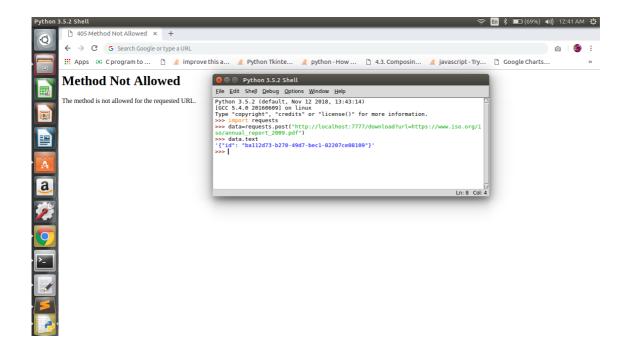

POST http://ec2-18-207-206-98.compute-1.amazonaws.com/download?url = <i href="http://ec2-18-207-206-98.com">http://ec2-18-207-206-98.com = </ href="http://ec2-18-207-206-98.com">http://ec2-18-207-206-98.com = <i href="http://ec2-18-207-206-98.com">http://ec2-18-207-206-98.com = <i href="http://ec2-18-207-206-98.com">http://ec2-18-207-206-98.com = <i href="http://ec2-18-207-206-98

Explanation [1]:

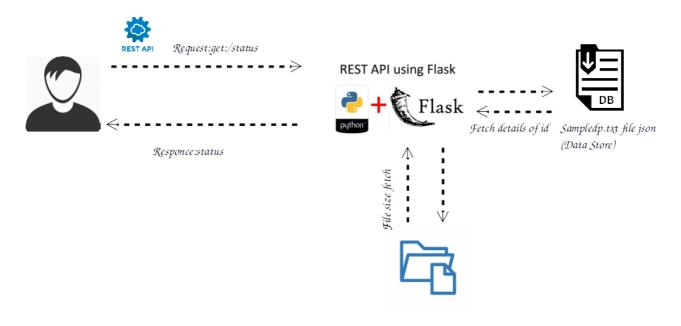

- -> checking connection given url ,if any error in connection returning error message to request.
- ->Creating a unique id (using uuid) and givend url headers storing in to local file (id is key, values is headers content)
- -> start one thread to download process .
- -> return id to response

ScreenShot [1]:

END POINT [2]: /status

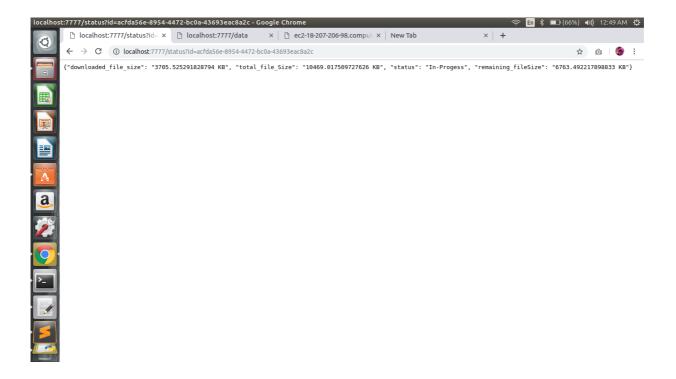

GET http://ec2-18-207-206-98.compute-1.amazonaws.com/status?id input

Explanation [2]:

- -> checking id in db (filedb.txt file here) if id not existing error message
- -> given id avalaible in db, fetch data from db
- ->from that data compare internal file size and server file size generate report and return result to response .

Screenshot [2]:

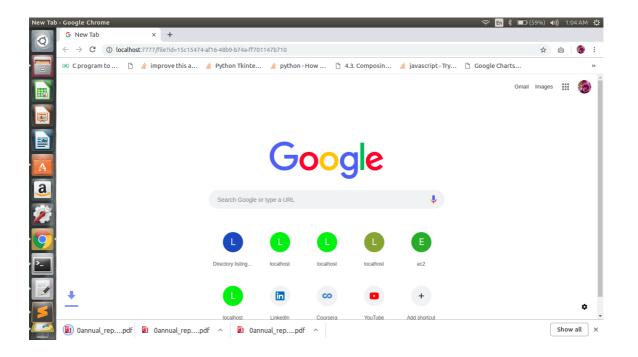

END POINT [3]: /file

GET http://ec2-18-207-206-98.compute-1.amazonaws.com/file?id input

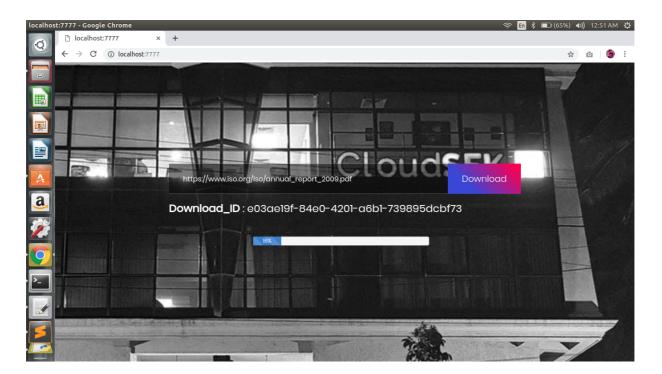

Explanation [3]:

- ->checking id available in db
- -> id available fetch informamtion and serve that file to download .

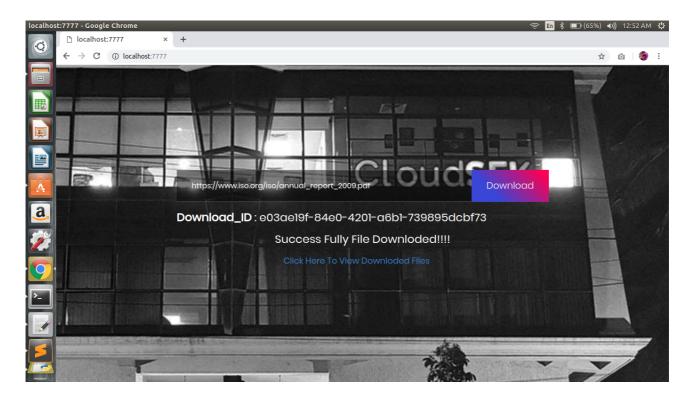

Screenshot [3]:
